

National Oil Company Database Data Update Summary – May 2022

In May 2022, the [Natural Resource Governance Institute](#) (NRGI) is publishing a data update of the [National Oil Company Database](#). This brief note explains the content of this data update. It can be read in conjunction with the [National Oil Company Database: Methodology Guide](#), which remains current as of this data update.

Inclusion of additional data from newly-issued reports

With this update we include data from company and government reports that had not been published as of the data cut-off for the previous data update in December 2021. Since then, many governments and companies published reports covering 2019, 2020 and 2021. The revised database therefore now includes data covering the years 2011-2021. In total, 40 of the 71 national oil companies (NOCs) in the database have reported at least some data for fiscal year 2020, and nine have some reporting for 2021. For some companies we include the available 2021 reporting, but we expect that later this year there will be further details to add following publish of additional reports, particularly 20F reports.

Altogether, including the 2021 reports, the update captures new reports covering 21 company-years (for 17 total companies) not available in the previous data update.

The appendix details the company-years for which new reports were published during this update period. The cut-off date for this May 2022 Update was 14 April, 2022.

Updates and corrections of existing data

The revision also includes some updates to data points that appeared in the database as of the prior update. In some cases, we added individual indicators where available data had previously been missed, or corrected individual indicators where we became aware of a calculation or transcription error. We did not alter the definition or interpretation of any indicators during this data update.

Where we updated data gathered directly from company and government reports, we also updated the data derived from those indicators. For example, changes to an indicator for a company's revenue from non-core activities for a particular year would also, in most cases, result in changes to the corresponding indicator for total revenue. Changes to an indicator for a company's operational expenditures would result in changes to the corresponding indicators for net income from core revenues and net income from all revenues.

Appendix. New reports captured in May 2022 data update

Company	Country	Years for which reports previously unavailable are captured in May 2022 update		
		2019	2020	2021
CNOOC Limited	China			x
Ecopetrol	Colombia			x
Equinor	Norway			x
ETAP	Tunisia		x	
GNPC (PIAC)	Ghana			x
KMG	Kazakhstan			x
NNPC (EITI)	Nigeria		x	
Perupetro	Peru			x
Petrobras	Brazil			x
PetroChina	China			x
Petroci (Company Report)	Côte d'Ivoire	x		
Petroci (EITI)	Côte d'Ivoire	x
